^aOnly sections related to areas of expertise.

I am eternally grateful to my reviewers. Their comments and suggestions have improved the quality of the content of this book. I've had four 'gurus' reviewing substantial portions. I've also asked other individuals to review smaller portions of the book related to their fields of expertise. I've been pleasantly surprised at the willingness of these experts to act as reviewers. This was a task that was done after hours and without any monetary compensation. What makes it extra-special is that I had very limited to no contact with my four gurus before writing this book. These experts agreed to review a book by an unknown person in South Africa writing about designing (mostly) to the Eurocodes. Thank you!

My gurus

- **Quay and sea wall design guru: Abdul Rahim.** Abdul has designed (and been involved in the construction of) more than 100 quay and sea wall structures in the Middle East. When I started my career, we used to refer to the 'Halcrow block wall' when we saw a specific cross-section – I'm privileged to have had one of the original Halcrow experts on the team. He has worked for Halcrow (now Jacobs) for over 21 years, and is currently a technical advisor at Vizhinjam International Seaport. Abdul has also lectured in his career, and has a master's degree in structural engineering.
- **Geotechnical/Eurocode 7 guru: Andrew Bond.** Andrew is a co-author of *Decoding Eurocode 7*. He has been involved in the development of Eurocode 7, and acts as the chair of the committee. His explanations of technical topics within his field make everything sound so easy. This, I've now realised, is a real talent and only possible if you have a thorough understanding of the topic. Andrew is the owner of Geocentrix, providing software for geotechnical engineering problems, and has more than 35 years' experience in the field. He provides a wide range of Eurocode training courses, has written a number of articles, papers and other publications, and was a visiting lecturer at Surrey University for 10 years after obtaining his PhD at Imperial College, London. What a pleasure to have had him on the team.
- **Wave action and overtopping guru: William Allsop.** If you've ever researched anything on wave action (and overtopping) on vertical walls, you would have come across William's numerous research papers and publications on the topic. He has written books, papers, contributed to ISO and British Standards as well as to Construction Industry Research and Information Association (CIRIA) and World Association for Waterborne Transport Infrastructure (PIANC) guidelines, and has presented on the topic. He has worked for HR Wallingford for 48 years, and is currently the owner of William Allsop Consulting. He is a well-known expert in this field, and currently busy with his PhD on old breakwaters. I am honoured to have had him as a reviewer.
- **Marine structures design to BS 6349 and Eurocodes guru: Stuart Richley.** Stuart is a Chartered civil engineer with ICE, and a senior engineer at Jacobs. Since graduating from the University of Plymouth, Stuart has worked in the maritime engineering design consultancy sector, frequently working with the Eurocodes and the BS 6349 maritime code. His experience lies in the design of coastal defence structures, wharf structures, and mooring and berthing systems. I am very lucky to have had him as a reviewer. His attention to detail and professional approach is remarkable.

Gerhard Kapp, a resident engineer at WSP, has extensive experience in working on marine works construction sites. He is a very clever person with the right practical experience. This combination is invaluable for ensuring designs and technical specifications are constructible. Gerhard is also the photographer of the cover image of this book.

Koos Schoonees, a professor in port and coastal engineering at the University of Stellenbosch, has experience working for scientific and research institutions (the Council of Scientific and Industrial Research (CSIR) and the University of Stellenbosch) as well as for engineering consultants. I've relied on his experience in physical modelling, overtopping and the design of rock structures as a reviewer. His willingness to answer all my questions is much appreciated.

Marius Rossouw, an engineer at WSP with a master's degree in coastal engineering, has 30 years' experience in physical and numerical modelling, and worked for a scientific and research institution (CSIR) before joining engineering consultants. His understanding of coastal processes and his 'easy' explanations were extremely helpful.

James Melvill, an engineer at WSP with a master's degree in hydraulic engineering, gained experience in the design of building structures to the Eurocodes when based in the UK. I chose him as a reviewer to bring a different perspective to the section on structural design.

Thesan Naicker, also an engineer at WSP, had the onerous task of checking the accuracy of the maths in the worked examples. Thesan is extremely detail orientated and does not miss a thing, making him the perfect candidate for this task.

One of my goals for this book was to include figures that are clear and descriptive. Linda Kilian, a CAD operator at WSP, came to the rescue. I must commend her patience throughout the process. I lost track of how often I requested changes to figures.

A big thank you to Simon Burchett for introducing me to Abdul and Stuart. Simon is on the BS 6349 development committee, and provided guidance when this book was still only an idea.

Then there is the person who believed in my idea from the start, James Hobbs from ICE Publishing. This book would not have been in print without you. When I was still making enquiries about the process, he was getting a contract ready. James guided me in the right direction, and patiently answered all my novice questions.

Thank you to my previous employer, WSP, for the use of its 'library' as well as allowing me to take leave at strange times. Thank you to Alison Bintliff, Alexander Chmoulian, Gert Jacobs, Felipe Guerrero, Paul Roux, Jon Shave, Patrick Beales, Karim Boualem, Nadine Cronje, André van Tonder, Hermanus Henning, Luther Terblanche, Paul Bouton, Daryl Ilsley, Ruth Pieterse, Adri Malan and any other industry colleagues who assisted in some way.

My family and friends, thank you for your love, support and encouragement. At times when 24 hours in a day were just not enough, you came to my rescue.

Thank you to you, the reader, for (hopefully) buying this book. I trust you will find it as user-friendly and helpful as I intend it to be.

Marisa Ackhurst, Pr Tech Eng
